Wind tunnel costs and times dominated aerodynamic database development before 1980.

Data from NASA SP-440 & online sources

But trends can change ...

Current wind tunnel costs \$3,000 - \$10,000/hour.

Length 56.14 meters/184.2 feet

Mass 2,041,166 kilograms/4.5 million pounds

Shuttle External Environments

Ground winds

Ignition Over Pressure

▶ 7.8 million lbs thrust

Ascent airloads

▶ Design $\bar{q} = 819$ psf

Separation Dynamics

Orbital debris

Hypersonic Entry

▶ 1650 °C/3000 °F

Ground Effects

“Engineering is the art of compromise,” Henry Petroski

Design goal

Lightest structure that can survive a harsh environment and maximize payload to orbit.

LH₂ @ -423 °F/20.4 K

External Tank

- ▶ 154 ft/47 m long
- ▶ 60,000 lbs empty/1,600,000 lbs filled
- ▶ 27,215 kg empty/725,748 kg filled
- ▶ Empty/filled = 1/27
- ▶ Typical soda can, 1/28, 14 gm/394 gm

LO₂ @ -297 °F/90.4 K

Post Challenger Shuttle Problems

- January 1986 No analytical capability to predict aerodynamics
- 1987 Joseph Steger & Pieter Buning/NASA ARC proposed development of an overset capability to simulate the Shuttle ascent configuration
- Initially focused on fast-separation abort and STS-1 trajectory lofting base pressure issues.
- Payload bay door loads and many more..

Reference: F.W. Martin, Jr., and J.P. Slotnick, "Flow Computations for the Space Shuttle in Ascent Mode Using Thin-Layer Navier-Stokes Equations," **Applied Computational Aerodynamics**, P.A. Henne, ed., AIAA, 1990, pp. 863-886.

Historical Perspective

- Discrepancies exist between aerodynamic predictions and flight experience.

- Force and moment data was easily corrected with flight derived aerodynamic increments.
- Aerodynamic loads (pressure distribution) cannot be readily corrected because of *limited* flight pressure measurements.

The loss of STS-107 initiated an unprecedented detailed review of all external environments.

Ascent **airloads**, acoustics, **heating**

Debris liberation, **transport** and capability assessments.

Bipod redesign assessments.

Greatly increased emphasis on verification & validation.

STS-114 and subsequent missions

- ▶ PAL ramp foam loss, additional redesign work.
- ▶ Prelaunch, inflight and postflight debris transport assessments.

Debris transport aerodynamic models & prediction tools developed

Current SSLV grid system

Wind tunnel validation and CFD extrapolation

Previous wind tunnel comparisons focused on wing loads.

CFD conditions: $M_\infty = 2.50$, $\alpha = 2.03^\circ$, $\beta = 0.00^\circ$, Reynolds # = $2.50 \times 10^6/\text{ft}$, IB elevon = 4.07° , OB elevon = -4.39°

WTT conditions: $M_\infty = 2.50$, $\alpha = 2.03^\circ$, $\beta = 0.00^\circ$, Reynolds # = $2.50 \times 10^6/\text{ft}$, IB elevon = 4.07° , OB elevon = -4.39°

AIAA 2004-2226

Wind tunnel test pressure comparisons show good agreement with predictions

JSC 2005-62925

Detailed comparisons along the LO₂ feedline were key to understanding protuberance airloads.

JSC 2005-62925

Proposed ice/frost ramp configuration, tested but not flown.

Timeline of Computing & Overset Space Shuttle Applications

We went to the moon without CFD or parallel computers. Why do we need them now?

- Reduce number of physical tests and improve relevance when you run test
 - Nearly 100,000 hours (11 years) of Shuttle wind tunnel testing
 - Many facilities have shut down or been mothballed
- Provides flight increments/ environments that cannot be obtained from other sources.

Overset CFD was a key part of many External Tank redesign assessments and debris assessments.

But there is still more work to be done...

STS-134, STS-135?

Some STS-1 flight anomalies are still beyond current CFD tool capabilities, e.g.

- Acoustics and heating on complex configurations with strong shock wave-boundary layer interactions
- Physical models (turbulence, chemistry, multiphase flows,...) are key limitations that need to be improved.

Future programs will need 10s to 100s of millions of CPU-hours to characterize external environments

- There is evidence that we need 10x more resolution and 10x more solutions than we can currently produce to generate grid converged solutions and populate databases.
